DETAILED ACTION

Reasons for Allowance

Claims 2-4, 7, 9-10, and 12 have been cancelled.

Claims 1, 5-6, 8, 11, and 13 are allowable.

Consider claim 1, the best prior art of record found during the examination of the present application, Ammar et al (US Patent Application Publication #2004/0203528 A1) in view of Birleson (US 2007/0182866 A1), fails to specifically disclose, teach, or suggest an outdoor unit of a reception terminal including a return channel, wherein the return channel (BUC) comprises: a local oscillator providing a signal with a frequency that can be selected from at least two frequencies, a transposition means that transposes a signal to be transmitted using the signal provided by the local oscillator, a wideband filtering means that allows through signals whose frequency corresponds to the transposed signal independently from the frequency of the local oscillator, and a configurable rejection filter depending on the frequency selected for the local oscillator; wherein the configurable rejection filter comprises a guided structure with a replaceable cover, wherein said replaceable cover may be either: a cover including cavities or slots, which configures said configurable rejection filter into a band rejection filter that rejects a bandwidth corresponding to a leak of the transposition frequency, or a flat cover, which causes the configurable rejection filter to operate as a substantially non-filtering element.

Claims 5, 6, and 8 are allowable because it is dependent upon independent claim 1.

Art Unit: 2618

Consider claim 11, the best prior art of record found during the examination of the present application, Ammar et al (US Patent Application Publication #2004/0203528 A1) in view of Birleson (US 2007/0182866 A1), fails to specifically disclose, teach, or suggest an outdoor unit of a reception terminal including a return channel, wherein the return channel (BUC) comprises: a local oscillator providing a signal with a frequency that can be selected from at least two local oscillator frequencies, a transposition means that transposes a signal to be transmitted using the signal provided by the local oscillator, a wideband filtering means that passes the signal from said transposition means resulting from selection of any of said at least two local oscillator frequencies, and a configurable rejection filter for rejecting a leak of transposition frequency for at least one of said at least two local oscillator frequencies; wherein the configurable rejection filter is configured through placement of a cover on a waveguide wherein the configurable rejection filter comprises a guided structure with a replaceable cover, wherein said replaceable cover may be either: a cover including cavities or slots, which configures said configurable rejection filter into a band rejection filter that rejects a bandwidth corresponding to a leak of a transposition frequency, or a flat cover, which configures said configurable rejection filter to operate as a substantially non-filtering element.

Consider claim 13, the best prior art of record found during the examination of the present application, Ammar et al (US Patent Application Publication #2004/0203528 A1) in view of Birleson (US 2007/0182866 A1), fails to specifically disclose, teach, or suggest an outdoor unit of a reception terminal including a return channel, wherein the return channel (BUC) comprises: a local oscillator providing a signal with a frequency that can be selected from

at least two frequencies, a transposition means that transposes a signal to be transmitted using the

signal provided by the local oscillator, a wideband filtering means that allows through signals

whose frequency corresponds to the transposed signal independently from the frequency of the

local oscillator, and a configurable rejection filter depending on the frequency selected for the

local oscillator; wherein the configurable rejection filter comprises a guided structure with a

replaceable cover, wherein said replaceable cover may be either: a flat cover, which configures

said configurable rejection filter into a band rejection filter that rejects a bandwidth

corresponding to a leak of the transposition frequency, or a cover comprising profiled elements,

which configures said configurable rejection filter to operate as a substantially a non-filtering

element.
